## ACKNOWLEDGEMENTS

I would like to thank those who, during all these years, have helped me in one or another way with their help and support.

First, I must thank my supervisors for their support during this thesis. This odyssey would have not started without Susana Marcos's suggestion and encouragement to could use my lab work to complete a good thesis. From her I learnt not only about science but also about how to do things right. Luis Díaz-Santana did not hesitate to offer his experience and support from London, giving me the possibility to get a PhD degree. John Barbur was there whenever his experience in academic procedures was necessary. Thank you all.

I would like to thank the Comunidad Autónoma de Madrid (CAM) and the European Social Fund because the fellowship they awarded me (1999-2001) allowed me to confirm that I like doing research.

Some people have contributed more directly to part of the work presented here even if their names do not appear in the corresponding chapter: Esther Moreno-Barriuso contributed in the myopic LASIK measurements and the early stages of the infrared-green comparison; Sergio Barbero participated in the measurements of Chapters 3 and 4; Guadalupe Rodríguez and Raúl Martín from IOBA organised and carried out the optometric measurements of the LASIK patients (Chapter 7); Agustín Mayo, also from IOBA, advised me about the statistics of polarisation (Chapter 3), and Laura Barrios about the statistics of calibrations (Chapter 2), sampling patterns (Chapter 5) and ametropic eyes (Chapter 6); C. Dainty and the Photonics Optics Group at Imperial College allowed L. Díaz-Santana the use and modifications of the HS waveform sensor utilised in Chapter 4 and Y. Tsang from City University helped during the experimental sessions in London; Alberto de Castro and Noemí Carranza helped me with Gaussian fitting algorithms, and Javier Portilla, Carlos Dorronsoro and Rafael Redondo helped me with the image processing of the passive eye tracking on Chapter 2. I would also like to thank all those who volunteered for being subjects in the different studies. This thesis would not exist without you.

Being in David Williams' lab in Rochester was a great opportunity which I really enjoyed. I would like to thank the organisers of the CVS undergraduate summer fellowship, and specially David Williams for giving me this opportunity. I would also like to thank the people I could interact with then, and specially Jason, Stacey, Nathan, Li Chen, and Debbie Shannon&Co. for their help.

I would like to thank Luis Díaz-Santana for the opportunity to spend some time in his adaptive optics lab. Thanks to Carolina, Franzisca, Brice, Cristiano and specially Marisa and for their help in London, and to Julien for his invaluable help in the lab. Thanks also to the staff for their help with the bureaucracy, and specially Steve Bunting for his help and patience.

Thanks to people from IOBA (especially Guadalupe, María, Isabel Vicky, Bety, Tomás, Raúl, Jesús) for being always so helpful.

Thank you also to my workmates: Esther, for teaching me so much in my first months in the lab; Sergio, for your help all these years in so many things; Patricia and Elena, for sharing basement and measurement sessions in the tough times, for your help and encouragement until the end, and for bearing me in the worst moments. Dani, thanks for sharing your knowledge about human nature, and about conics fitting. Carlos, thanks for your effort to make the LRT2 system

work, for your enthusiasm and for the times you have supported me. Sergio thanks for your help, trying to explain me all those hardcore optics. Enrique and Alfonso, for your help in the lab and for trying to make me more positive. It might work from now on. Requejo, I really learnt a lot from you. Damian, thanks for devoting your spare time selflessly to help me. Alberto, thanks for your help from Gaussian fitting to measurements, for your patience and for interesting discussions. Lucie thank you for so much: for your help and patience, for your hard work, for cheering me up and teaching me so much...and for discovering me the Tariquet!! Laura, thank you for being always ready to help and for sharing your happiness with everyone. Thanks to you both for being the other two Ls and for your permanent smiles. Saro, it was great to have you in the lab, and to keep in touch since, thanks for your support. Thanks also to Ainara and Vincenzo for being so supportive, good listeners and patient, to Noemí for being the helpful specialist in Word templates and for learning court procedures with me, among other things, and Ana, Vali, Sylvain, Héctor, Amelia, Raul, Oscar, Víctor, Dani, Sara, Michela, Andrés (bambino!), Jesús (mozo!), Alex, Isi, David, Elena, Jeremie, Marcial, Lorena, Lidia, Cristian, Jose A., Vincenzo G, Jan, Portilla, and of course Matts (and Esther), José Luis, Belén, Erwin & Robin, M<sup>a</sup> Ángeles...

Thanks to all the colleagues that, during all these years, have helped me in one or other way. Thanks to Steve Burns for processing the sampling patterns data almost in real time from the other side of the ocean and for his advices.

Thanks to all the staff of Instituto de Óptica in Madrid: Chary, Encarnita y Eloy por resolver tanto con paciencia y una sonrisa; a Sole, Encarnita, Yali, Eduardo y Mari Paz por la paciencia con el flujo de pacientes. Paquita, muchas gracias por tu cariño. Gracias Benito por tu ayuda en el taller. Marisa, M<sup>a</sup> Luisa, Sole, Cecilia gracias por mantener todo limpio y ordenado con una sonrisa. Belén, Chema y demás gente de mantenimiento, gracias por solucionar las cosas casi al momento. M<sup>a</sup> Jesús muchas gracias por tu eficiencia y tu amabilidad a cargo del almacén. Armando, muchas gracias por tu ayuda todos estos años especialmente por resucitar al LRT2 tantas veces, junto con Gema y Carlos. Carlos, gracias por tu ayuda tantas veces tan paciente y eficientemente. Gracias Vicente y Pepe Granados por vuestra ayuda cada vez que la he pedido.

No habría podido llegar aquí sin los que me habéis ayudado con mis problemas de salud. Gracias a todos, y especialmente a Alicia Hernán, Eduardo Zamorano, Yolanda Plata y Sofía (Fisyos).

Muchas gracias por vuestra paciencia a todos los que habéis sufrido mi estrés o mis desapariciones en las peores épocas, sobre todo a Silvia y a Mari Paz por su infinita paciencia y cariño, y a Rebeca y Ana por soportar mis peores momentos en casa. Especialmente quiero dar las gracias a mi madre porque gracias a su "el no ya lo tienes" he llegado a hacer cosas de las que nunca me hubiera imaginado capaz. Por su comprensión, por su apoyo constante y por enseñarme que uno tiene que vivir según sus reglas aunque juegue en desventaja, si quiere ser feliz. Sin ella hoy no estaría aquí...en todos los sentidos. A mi padre, por las veces que me ha apoyado pese a no entender por qué trabajaba tanto en algo que ni me aseguraba un futuro ni me sacaría de pobre, por mantenerme con los pies en la tierra. Ambos me han enseñado a trabajar duro y hacer las cosas bien hechas. A César, Javi, Marta y Ana, por las veces que han tenido paciencia conmigo y las que me han hecho reír cuando estaba a punto de llorar. Eso no tiene precio, y no lo consigue cualquiera. To Neil...he knows why.

## Abstract

In this thesis the laser ray tracing (LRT) technique for measurement of ocular aberrations has been implemented, validated and applied, in conjunction with complementary techniques, to the study of ocular aberrations in human eyes. In particular, we studied optical aberrations in myopic and hyperopic eyes and the optical changes induced by refractive surgery for myopia and hyperopia.

We have studied the impact of the optimisation of some experimental parameters on the estimation of the wave aberration. We demonstrated that although the polarisation state and wavelength of the illumination light affected the intensity patterns of the images obtained using reflectometric aberrometry (LRT and Hartmann Shack sensor), these changes did not affect the estimation of aberrations. We also showed that the difference in the defocus term (focus shift) due to the use of different wavelengths is in agreement with the Longitudinal Chromatic Aberration of the Indiana Chromatic Eye Model for average normal eyes, although intersubject variability is not negligible. In addition, we studied experimentally the influence of the geometrical distribution and density of the pupil sampling on the estimation of aberrations using artificial and normal human eyes, and performed numerical simulations to extend our results to "abnormal" eyes. We found that the spatial distribution of the samples can be more important than the number of samples, for both our measured as well as our simulated "abnormal" eyes. Experimentally, we did not find large differences across patterns except, as expected, for undersampled patterns.

We found that hyperopic eyes tended to have more positive asphericity and greater total and corneal spherical aberration than myopic eyes, as well as greater 3rd and higher order aberrations. Although we found no significant differences between groups in terms of internal aberrations, internal spherical aberration showed a significant age-related shift toward less negative values in the hyperopic group. We also assessed the impact of the LASIK corneal surgery, a popular surgical technique for correction of refractive errors, on the optical quality for both myopic and hyperopic standard techniques. Third and higher order ocular and anterior corneal aberrations increased with the surgery. Ocular and corneal spherical aberration changed towards more positive values with myopic LASIK, and towards more negative values with hyperopic LASIK. Changes in internal spherical aberration were of opposite sign than those induced in corneal spherical aberration. Changes induced by hyperopic LASIK were larger than those induced by myopic LASIK for a similar attempted correction.

## KEY FOR SYMBOLS AND ABBREVIATIONS

2D	two dimensional
3D	three dimensional
A49	Albrecht pattern with 49 samples
AL	Axial Length
AL/CR	Axial Length to Corneal Radius ratio
ANOVA	Analysis of Variance
CCD	Coupled Charge Device
Cn	Circular pattern with n samples
CPP	Conjugate Pupil Plane
CR	Corneal Radius
CRT	Cathode Ray Tube
CSF	Contrast Sensitivity Function
D	Dioptries
DF	Dichroic Filter
FA	Field Aperture
FB	Focusing Block
GRIN	Gradient Index
HCA	Hierarchical cluster analysis
He-Ne	Helium Neon
Hn	Hexagonal pattern with n samples
HOA	3 <sup>rd</sup> and Higher Order Aberrations (excluding piston, tilts, defocus and astigmatism)
HS	Hartmann-Shack
i.e.	id est, this is
IR	Infrared
J49	Jacobi pattern with 49 samples
$\lambda$	Wavelength
L	lens
L49	Legendre pattern with 49 samples

LASIK	Laser Assisted In situ Keratomileusis
LCA	Longitudinal Chromatic Aberration
LED	Light Emitting Diode
LP	Linear Polariser
LRT	Laser Ray Tracing
LRT1	1st generation laser ray tracing device
LRT2	2nd generation laser ray tracing device
$\mu\text{m}$	microns
MPE	Maximum Permitted Exposure
mrad	milliradians
MTF	Modulation Transfer Function
nm	nanometres
$^\circ$	degrees
OCT	Optical Coherence Tomography
PCBS	Polarising Cubic Beam Splitter
PRK	PhotoRefractive Keratectomy
PSF	Point-Spread Function
Q	Asphericity
QWP	Quarter Wave Plate
R	Radius of curvature
RMS	Root Mean Square wavefront error
Rn	Rectangular pattern with n samples
RPE	Retinal Pigment Epithelium
SA	Spherical Aberration
SE	Refractive error Spherical Equivalent
SF	Spatial Filter
SRR	Spatially Resolved Refractometre
std	standard deviation
TCA	Transverse Chromatic Aberration
vs	Versus, compared to
